The Very First Guide

A Beginner-Friendly Walkthrough — No Prior Terminal Experience Required

A single booklet for someone who has never touched this before

2026-05-20 · Project Author · v1 (EN)

Before We Start

I am writing this booklet for someone who isn't quite sure what a "terminal" is yet. So when a technical term shows up for the first time, I'll add a short plain-language gloss right next to it. Take it slow.

Here is the big picture in one sentence: **we built a system where you speak to AI assistants inside a Discord chat room, and they do the work for you.** There are two installable bundles that bring those assistants to your computer.

Name	One-line description
ThisCode	Claude-based assistant bundle. The default home for all five team bots.
ThisCodex	Codex-based bundle (OpenAI's coding tool). Handles code review.

THE PROMISE OF THIS BOOK

You don't need to memorize anything. A good AI user is not someone who memorizes commands — it's someone who can **check the current state in small steps and decide the next move.** This book teaches that habit.

1

Why Discord?

A chat app as your AI console

Driving AI through a messenger

Most AI tools require you to type commands into a black text window — the **terminal** (a text-based input window). For a beginner, that black window feels scary. So we picked Discord, **an app you already know**, as the front door.

Using a terminal	Using Discord
Must remember exact commands	Ask in plain words
Must sit at your computer	Works from your phone, one line is enough
Output scrolls away	Chat history sticks around

Your team has several assistants

One bot does not do everything. The bots split the work by role and collaborate inside a Discord channel — much like a human team.

Bot (generic name)	Role
research-bot	Research, fact-checking
code-review-bot	Code review
schedule-bot	Schedule, reminders
writing-bot	Writing, documents

orchestrator-bot

Overall coordination, meetings

CHAPTER 1 CHECKPOINT

“Discord is the front door, and inside live several role-specific bots.” Take that one sentence with you.

2

Which Bot to Run?

Pick by situation, not by name

Choose by what you want to do

Don't memorize bot names. Pick by "what am I trying to do right now?"

What you want to do	Bot to wake up
Find and organize information	research-bot
Have someone review my code	code-review-bot
Track what I planned and when	schedule-bot
Write a document or article	writing-bot
Coordinate several bots together	orchestrator-bot (calls the rest)

If this is your first time, start with one

Don't turn them all on. Start with **the one you'll use most often**, get comfortable, then add more. Most beginners start with research or writing.

WHY NOT ALL AT ONCE?

More running bots means more computer resources used, and it gets harder to tell who said what. Follow the order **one** → **comfortable** → **add**.

3

Installation (Branch by Situation)

Pick your path

The big picture is just three steps

The setup helper asks you the details one at a time. You only need to know the overall flow.

Step	What happens
1. Get the bundle	Download ThisCode or ThisCodex to your computer
2. Run the setup helper	The helper asks about folders and bot location
3. Connect Discord	Link your Discord channel to the bots

Which branch are you on?

BRANCH A — I MAINLY USE CLAUDE

Install **ThisCode**. The setup helper is called `/thiscode:setup`. Ask for it in chat like this, and the helper will walk you through step by step.

Please run `/thiscode:setup` and help me install it

BRANCH B — I ALSO NEED CODE REVIEW

Add **ThisCodex**. The install command is the one line below. `--apply` means “don’t just check — actually apply the changes.”

```
thiscodex init --apply
```

WHEN THE HELPER ASKS QUESTIONS

The setup helper asks **one question at a time**. If you don’t know what to answer, press Enter to accept the safe default — the helper is built to stop safely rather than do something risky. Don’t be afraid.

CHAPTER 3 CHECKPOINT

Install = receive → run helper → connect Discord. The helper **asks** its way through. You only need to remember the one or two commands above.

4

alias · yolo · discord

Three words you'll hear a lot

Let me unpack the three words that come up most often. Knowing what they mean is enough.

alias — a short nickname for a long command

An **alias** (nickname) lets you give a **short label** to a long, complex command. For example, the long command that wakes up a bot can be shortened to a single word like `mybot`. The setup helper prints an alias block using the runtime name you chose. Source it for the current shell, or paste it into your rc file only when you want it to persist.

```
mybot # nickname for 'wake up my bot' (long command)
```

yolo — proceed automatically without asking each time

yolo (auto-proceed mode) lets the bot finish a task **on its own** instead of asking “is it OK to do the next step?” each time. It’s faster, but also means you trust the bot to keep going — so the helper asks once before enabling it.

YOLO PITFALL

Don’t enable it just because it’s convenient. yolo can perform hard-to-undo actions (such as deleting files) automatically. Start with it **off**, then turn it on once you’re comfortable.

discord — the channel between you and the bots

Setting up the **Discord** connection means deciding “which chat room’s bot listens to me.” Once you connect it, just typing into that room is enough to make the bot work — even from your phone.

CHAPTER 4 IN ONE LINE

alias (nickname) shortens commands · yolo (auto) lets the bot finish on its own
(handle with care) · discord (link) builds the channel you talk through.

5

How the Memory Works

What the bots remember and why

Bots have memory too

So a bot doesn't forget important things between conversations, there is a **memory** (a place where the bot stores facts). It comes in two flavors.

Memory kind	What goes in
Shared memory	Facts, rules, and user preferences all bots can see
Per-bot memory	The bot's own tone, recovered mistakes, personal notes

Today's approach vs. a better one

Today, when a session starts the bot loads the entire shared memory **all at once**. As the pile grows, you hit the "it remembers everything but can't surface the right thing" problem. So we are studying the better-built memory systems out there and designing an improved approach.

RESEARCH TAKEAWAYS (IN PLAIN WORDS)

- **Hybrid search is the standard** — combining meaning-based search and relationship-based search is today's default. Single-method search is the older way.
- **Time-handling is the differentiator** — instead of deleting old memories, mark them as "old version." It makes retracing easier.

- **Memory should evolve** — when a new note arrives, it can update the links of older notes automatically (A-MEM style). This fits our Obsidian-based structure well.

WHAT A BEGINNER ACTUALLY NEEDS TO KNOW

The bot takes care of the memory internals. As a user, it's enough to remember this: **“the bot keeps important things, and instead of deleting old stuff it marks it as old.”**

6

When It Doesn't Work

Troubleshooting basics

Don't panic if you're stuck. **Don't guess** — **narrow it down, top to bottom**. Going through the list one item at a time solves most issues.

Four common symptoms

Symptom	Where to look first
The bot doesn't respond	Is the Discord connection alive? (Ch. 4)
"command not found"	Is the alias saved? Did you open a new window?
Korean / non-ASCII text looks broken	Font installation (the PDF uses system fonts)
The bot touches the wrong folder	Rerun the setup helper to reset the location

If it still doesn't work

JUST CHECK THESE THREE LINES

1. Am I in the right folder? · 2. Is the bot awake (does it respond on Discord)? · 3. What did I just change? — Tell the bot these three lines as-is, and the bot will narrow down the rest.

DON'T DO THIS

Don't keep running the same command in hope it will start working, and don't blindly run delete commands you don't understand. The fastest path is to **write one sentence describing what's broken** and ask the bot.

ONE LAST WORD

Twenty minutes of fighting in the wrong folder is worse than ten seconds of “wait — am I in the right place?” Go slowly, check in small steps. — Project Author
